Bald Cypress:
August Tree of the Month.
August is a great time of the year. Football will be starting soon. The kids are going back to school. On top of all that, It's Indiana State Fair time. The State Fair has become a very important bonsai event for us. For the past five years, we've been putting on a fantastic display. Our bonsai display has become a must-see event for many fair goers. As many of you know, this is not just an Indianapolis Bonsai Club display, but a statewide event. The show is a ten day event, which actually features two separate sessions. During the first session, we feature the conifer and deciduous trees. During the second session we feature tropical and indigenous to Indiana trees.

This year, we've had a slight change with the divisions and how trees will be judged. Although ribbons are nice, this article isn't about ribbons. It's about displaying our hobby and showing off our works of art. Most of us are members of the bonsai club because we enjoy the hobby. We want others to enjoy our hobby, too. In effect, our trees and those who take the time to volunteer at the fair, are like ambassadors. We introduce people to our hobby. Many members of the bonsai club became club members after seeing the State Fair Exhibit. The club normally gets a spike in membership every year thanks to our efforts at the fair. The stronger our club membership, the more opportunity there is for all of us to enjoy an improve on our hobby.

Once again, I am hoping for great participation at the State Fair. Please consider showing a couple of your favorite trees at the fair. Also consider covering a shift or two at the State Fair bonsai display. We are supposed to have someone present at the display during the hours that Ag/Hort. building is opened. The building is opened from 9am - 9pm. We need to be there to watch over the trees, water the trees when needed and to answer questions of people viewing the display. Often, it's many of the common questions, like 'How old is it,' 'How big will it get,' and then we get the guy that walks by and yells, 'Banzai!'

For those of you who wish to participate by showing a tree, please take the time to make sure that your tree is looking it's best. Make sure that the pots are clean. Remove yellow or damaged leaves. Pull the weeds and cover the surface of the soil with moss. Remember to show your tree on some sort of stand or mat. You should also display your tree with an accent plant or accent stone. That may be a lot to think about, but don't be intimidated. Just try to do the best you can with what you have. One of the best parts of showing your tree is the fact that you get your tree critiqued by a bonsai professional. I think that both of our judges are fairly easy going guys. I think you can expect critiques that will be more encouraging than critical. The first session will be judged by Brussell Martin. The second session will be judged by Ed Trout. Furthermore, the upcoming August meeting will feature a tropical bonsai demonstration conducted by Ed Trout. If you were at the last meeting or the club picnic, you had the chance to see the huge Jaboticaba that Ed will be working on. It's an impressive tree now. I can't wait to see how it looks after Ed's presentation.

I hope to see all of you at the upcoming Indiana State Fair and the August IBC meeting.

Take care,

Scott
What To Do:
By Mark Fields
Mid-July through Mid-August

Pruning, pruning, pruning....seems it's a never ending task this time of year. I carry a pair of scissors and a basket whenever I'm in the bonsai garden. In some cases you want to let the tree grow out of its profile, such as when an unhealthy tree is trying to regain its vigor. Or, if you are letting a sacrifice branch grow. In such cases, use your own discretion as to when it needs to be cut off.

Continue a regular fertilization schedule as long as the trees are growing. In August they generally go into a summer dormancy period. At that time, hold off on fertilizing.

When conifers go into summer dormancy, it is safe to repot them. It is also safe to dig evergreens safely. I learned this when I had a nursery and would regularly dig taxus and junipers in August. When this is done, they have a chance to push new roots prior to fall and winter ensuring their survival. It is important to move them into shade for a while after digging and repotting before acclimating them back to the full sun.

Watering is key this time of year too. My rule of thumb is to water 2 to 3 times a day when temps are above 90 and 1 to 2 times a day when temps are in the 80’s. However, if it rains sometime during the day, check the soil to ensure there was sufficient enough rain to saturate the soil mass. If not, water!

Keep an eye out for pests and diseases and treat as necessary. Fungus is a problem when we get a lot of rain like we have this year. Some trees are unaffected while others are prone. Powdery mildew is the biggest pest. There are several sprays on the market to treat or prevent this problem.

Of course here in Indy, its time to get your trees ready for exhibition at the Indiana State Fair! Keep them healthy and pest free!

Mark Fields

IBC LOGO ITEMS
Scribbles Embroidery of Arkansas has the Indianapolis Bonsai Club logo on file and they can produce dress shirts, polos, t-shirts, caps, bags, sweatshirts, fleece pullovers, etc in a wide selection of colors, both product and logo. This allows IBC members to purchase any item any time they wish. You can visit their website at www.scribblesemb.com to see their selection and place your order.
In the wild, the Bald Cypress tree grows in wet, swampy soils along riverbanks and flood plains. Specimens of this plant have reached ages as old as 1000 years. Although the tree generally likes wetter climates, it has been grown as far north as Minnesota, New York and Southern Canada.

The circular strands the tree grows in are far different than how a Bald Cypress bonsai plant will grow. When looked at from afar, the strands of tree take on an almost dome-like shape. Needles on the tree grow in rows of two along the slender twigs. This deciduous plant loses its needles in winter, but may dried leaves will often remain on the Bald Cypress until springtime.

Relatives

One of the closest relatives to the Bald Cypress is the Pond Cypress. Much like the Bald Cypress is appearance; the Pond Cypress has a smaller stature and grows around the edges of swamps. Seeds from this close relative are often eaten by neighboring squirrels and birds. As parts of the Taxodiaceae family, these two trees have much in common.

Growing A Bald Cypress Bonsai

Bald Cypress bonsai trees should be grown in full sun in zones 5B through 9. Although it can be grown outside of these ranges, the bonsai will need protection during the harsh months of winter. Growers should plan on watering the plant every day if the live in the south. During the summer, the pots of this plant should grow in rows of two along the slender twigs. This deciduous plant loses its needles in winter, but may dried leaves will often remain on the Bald Cypress until springtime.

Pruning & Wiring

When pruning the tree, try to keep in mind the styles that the Bald Cypress looks best in. Growers have noted some success growing it as a formal upright, group, twin-trunk, informal upright, literati and slanting. Normally, the plant will grow in the open in the wild and have a group of horizontal and drooping limbs. The formal upright is the best way to grow it into a bonsai tree, but others will work well also.

In Florida, many of the trees found will actually be an Everglades Cypress or a Pond Cypress. Since these trees are more scraggly, they grow better in the literati style. Some more diminutive cypress have branches that start almost at the ground and grow along the trunk.

The Bald Cypress is a very fast growing tree and has to be watched very closely. If growers do not keep an eye on their bonsai, the wires can potentially damage the bark. To prevent this, the branches could just be tied down using twine instead of wire. Some growers have noted success with making a slight incision on larger branches. This enables them to pull the branch down and the Bald Cypress will soon heal its wound.

Shaping The Foliage & Making Cypress Knees

To shape the foliage, just pinch back new growth. If the branch needs to be thickened, growers can let it grow on its own for a season and then prune it in the early spring. Wherever the tree is pruned, a new sprout will shoot out of the area. Leaves can be plucked off from desirably places and the tree can be pruned throughout the entire summer.

If the grower wants to develop cypress knees, they just need to go longer without repotting the plant. Normally, three years will suffice. Roots can be brought to the surface and allowed to thicken up to form the knee. Over the course of a few years, the bonsai's root will thicken and look like the knees do in the wild.

Propagating & Repotting The Bald Cypress

Users can use cuttings or air layering to propagate their bonsai. Any potting or root pruning should be performed in spring. These plants have been known to grow three feet in just a single year, so root pruning needs to be done at a minimum of every other year.

Unlike other bonsai plants, the Bald Cypress does not need loose, gravely soil. In the wild, it is normally surrounded in swampy, wet earth and this effect should be recreated in real life. Heavy soils like mushroom compost work very well. If the soil is not heavy enough, the bonsai will not receive enough moisture. It is almost impossible to get the Bald Cypress’s roots to rot, so always select a soil that retains as much water as possible.

Pots for the Bald Cypress should be flat and shallow. To make it more aesthetically pleasing, the Bald Cypress normally matches earth tones and dull glazes very well. Since the pot will often be submerged in water, a smother finish can aid in cleaning off the dirt afterward.

Diseases & Pest Problems

Although the Bald Cypress is not susceptible to most pests, it does have a problem with Twig Blight. This weak pathogen is normally found on tissue that is dead or injured. If the tree is stressed from being over pruned, the fungus will attack and kill the tips of the branches. Any dead or diseased branches should be instantly pruned and not left on the tree. By pruning correctly and regularly fertilizing the soil, this issue can be avoided.

Overall, this plant does very well when grown as a bonsai. The elegant shape and feathery foliage look beautiful when paired with an earthen pot. Popular among bonsai aficionados of all types, this bonsai tree is especially well-suited for beginners. It is simple to grow and not susceptible to a broad ranges of diseases and pests. For anyone looking to pick up bonsai as a hobby, the Bald Cypress is a great first choice. The iconic shape is well-suited to bonsai trees and easy to make for any new hobbyist.
Indianapolis Bonsai Club
July 2nd, 2014
Meeting Minutes
Amanda Cox

Date & Time: July 2nd, 2014 from 7:00-9:00
Location: Garfield Park Conservatory Meeting Room
Presiding: Club President Scott Yelich
Attendance: 18
Membership: 39 Paid Members
Checking/Savings Balance: $3567.00

State Fair August 1st - 9th
*Volunteers Needed*
Set Up July 31st
Conifers /Deciduous August 1st-6th Judge: Brussel Martin
Tropical/Indigenous August 6th-9th Judge: Ed Trout

Next Meeting: August 6th
Ed Trout: Tropical Demo on Jaboticaba

Tree of the Month: American Beech
Presented By: Jack

July Presentation: Putting it all together for show
Presented By: Mark Fields
Exhibiting Bonsai: A visual sampling of “How to” by Mark Fields
